

Use this PDF in Cursor when normal TXT/CSV/JSON/SQL attachments are not recognised.

Tell Cursor: read this PDF as the authoritative facility-master upload pack. Recreate the listed files inside the repository under docs/data/facility-master-2024-07-23/ and then implement the Tuso, Ndila and related vNext integrations exactly as instructed. Do not create frontend-only mocks or hard-coded arrays. Use real service APIs, migrations, seeds, validation, tests, and parity gates.

```
# Cursor Prompt: Import and Wire Master Health Facility Data into Impilo vNext
```

You are working in the Impilo vNext repo. Use the attached facility data pack derived from the ****Master Health Facility List dated 23 July 2024****.

```
## Uploaded artefacts to use
```

- `master\_health\_facilities\_clean.csv` - canonical flat import table.
- `master\_health\_facilities\_clean.json` - full JSON array for services/tests.
- `master\_health\_facilities\_clean.jsonl` - streaming-friendly seed file.
- `tuso\_facility\_registry\_seed.json` - facility registry seed for Tuso.
- `ndila\_facility\_location\_seed.json` - location seed for Ndila.
- `ndila\_health\_facilities.geojson` - map layer for Ndila and preview map tests.
- `facility\_lookup\_values.json` - provinces, districts, types, ownership, location, level, status.
- `facility\_data\_quality\_report.json` - data quality issues to treat as warnings/gates.
- `tuso\_staging\_seed\_postgres.sql` - optional staging table SQL, not production migration.

```
## Critical doctrine
```

1. No mocks, no stubs, no replacing existing service logic with a toy implementation.
2. Import into staging/seed paths first. Do not blindly overwrite production-like Tuso records.
3. Treat `facility\_code` as an important national identifier but not as the only unique key, because the source contains duplicates/missing values.
4. Use `facility\_uid` as the pack-generated stable import key for seed/staging only. Reconcile with canonical Tuso facility IDs during ingestion.
5. Coordinates must be validated before operational use. Ndila may display valid coordinates immediately, but records without valid coordinates must remain searchable by name/province/district and must be flagged for geocoding/review.
6. Contact numbers are operational metadata. Do not surface personal/contact numbers broadly in public/citizen-facing UI unless role/permission rules allow it.
7. Preserve existing vNext Core Transaction Doctrine and Coherent Experience Orchestration. This dataset should strengthen real journeys, not create another disconnected list.

```
## Required implementation work
```

```
### Phase 1 - Product Truth Recovery for existing facility/location code
```

Inspect existing code before changing anything:

- Tuso facility registry models, migrations, DTOs, importers, APIs, tests, UI surfaces.
- Ndila maps/geospatial models, APIs, layers, map components, search/autocomplete.
- Shared lookup/reference-data mechanisms.
- Existing service-discovery, booking/appointment, telemedicine, Nhume dispatch/delivery, Varapi provider affiliation, Nompilo search, Simba/Oros/Costa integration points.

Produce an implementation note in the repo explaining:

- existing facility data structures,
- what identifiers already exist,
- where imports belong,
- what must not be broken.

```
### Phase 2 - Tuso facility registry import
```

Implement a robust import path for `tuso\_facility\_registry\_seed.json` / `master\_health\_facilities\_clean.csv`.

Tuso should support:

- facility name, facility code, province, district;
- facility type;
- ownership;
- rural/urban/peri-urban location context;
- care/service level;
- operational status;
- bed capacity;
- contact metadata with access controls;
- source dataset/date;
- data quality flags;
- duplicate-code reconciliation workflow.

Required behaviours:

- Idempotent import.
- Dry-run mode.
- Validation report.
- Duplicate code warnings.
- Missing code warnings.
- Missing/invalid coordinate warnings passed to Ndila review queue.
- No destructive overwrites unless a deliberate merge/reconcile command is used.
- Tests proving repeated imports do not create duplicates.

Phase 3 - Ndila geospatial wiring

Use `ndila\_facility\_location\_seed.json` and `ndila\_health\_facilities.geojson`.

Ndila should support:

- facility map layer;
- facility search by name/code/province/district/type/level;
- bounding-box query;
- nearest-facility query where coordinates exist;
- graceful handling of records without coordinates;
- geocoding/review queue for missing/invalid coordinates;
- map preview layer for web and mobile where applicable.

Required tests:

- valid GeoJSON loads;
- point count equals valid coordinate count;
- no coordinate reversal;
- nearest query excludes invalid/missing coordinates;
- search still returns facilities without coordinates.

Phase 4 - Wire other vNext services/features

Use the facility registry as a real shared national reference. Wire or confirm integration points for:

- **Vito** / client journeys: facility selection during registration, My Life care context, nearest service discovery.
- **Varapi** / provider journeys: provider affiliation, workplace selection, postings, facility-based authorization.
- **Telemedicine**: facility-based teleconsult routing, referral context, virtual-to-facility escalation.
- **Appointments and bookings**: selectable facility, service availability context, client-facing search.
- **Nhume**: pickup/drop-off nodes, dispatch destination/source nodes, route planning through Ndila.
- **Simba** / Oros: commodity order source/destination facility nodes.
- **Costa** / billing: facility context, level/type assumptions, reporting.
- **Nompilo**: natural language search for facilities and services using Tuso/Ndila APIs, not a hardcoded frontend array.
- **Dashboards**: counts by province, district, ownership, service level, operational status, and coordinate completeness.
- **Mobile apps**: provider and citizen app facility search/list/map parity with the web experience.

Phase 5 - Frontend and experience completion

Create complete UI flows rather than admin-only raw tables:

- admin/import validation screen;
- Tuso facility registry list/detail;
- facility map view powered by Ndila;
- facility profile page with service-level/ownership/location/bed-capacity metadata;
- warnings where coordinates/codes need review;
- citizen/provider search surfaces where appropriate;
- mobile parity tests for facility search/list/map behaviours.

Phase 6 - Tests and gates

Add or update tests:

- schema validation;
- import idempotency;
- duplicate handling;
- API contract tests;
- backend/frontend parity;
- mobile parity;
- map/GeoJSON loading;
- search/filter tests;
- role-based visibility tests for contact details;
- regression tests ensuring no existing vNext functionality is removed.

Quality gate must fail if:

- seed import creates duplicate facility records on repeated run;
- web/mobile frontends use mock facility arrays while backend APIs exist;
- Ndila map uses reversed lat/lon;
- contact metadata is exposed to unauthorized/public context;
- existing service APIs are replaced by stubs;
- core transaction journeys lose existing functionality.

Dataset summary

- Total records: 2023
- Open records: 1340
- Valid coordinate records: 1874
- Missing/invalid coordinate records: 149
- Missing facility code records: 124
- Duplicate facility code count: 39
- Provinces represented: 10
- Districts represented: 74

Expected final output from Cursor

1. A short implementation report listing changed files and confirming no regressions.
2. Passing tests/gates.
3. Working Tuso facility registry import.
4. Working Ndila facility map/search layer.
5. Web and mobile previews showing real facility data from service APIs.
6. Data quality review list for missing coordinates, missing codes and duplicate codes.

Cursor Flat Facility Upload Manifest

Upload these files individually rather than as a zip. Start with the TXT prompt, then attach the CSV/JSON/GeoJSON/SQL files as needed.

```
- `CURSOR_PROMPT_facility_master_Tuso_Ndila_vNext.md` - Main Cursor prompt for implementation. (7,364 bytes)
- `PASTE_INTO_CURSOR_facility_master_Tuso_Ndila_vNext.txt` - Same prompt as TXT, for Cursor upload/paste compatibility. (7,364 bytes)
- `README.md` - Pack guide. (1,604 bytes)
- `README.txt` - Pack guide in plain text for Cursor compatibility. (1,604 bytes)
- `facility_data_quality_report.json` - Data quality checks: duplicates, missing codes, missing coordinates, status/type summaries. (67,873 bytes)
- `facility_lookup_values.json` - Enumerations/lookup values discovered in the source data. (3,106 bytes)
- `master_health_facilities_clean.csv` - Primary clean flat file for Cursor/import scripts; easiest to inspect and diff. (443,070 bytes)
- `master_health_facilities_clean.json` - Full clean JSON array for seed/import services. (1,510,874 bytes)
- `master_health_facilities_clean.jsonl` - Line-delimited version for streaming/import jobs. (1,310,594 bytes)
- `ndila_facility_location_seed.json` - Ndila-specific location seed focused on mappable facility fields. (724,246 bytes)
- `ndila_health_facilities.geojson` - GeoJSON FeatureCollection for maps, routing, facility proximity and geospatial previews. (1,811,362 bytes)
- `tuso_facility_registry_seed.json` - Tuso-specific facility registry seed focused on identity, classification and administrative fields. (1,089,209 bytes)
- `tuso_staging_seed_postgres.sql` - PostgreSQL staging table + COPY-friendly load instructions for Tuso ingestion. (1,017,192 bytes)

# Impilo vNext Facility Master Cursor Pack
```

This pack converts the uploaded ****Master Health Facility 23 July 2024**** workbook into Cursor-friendly artefacts for Impilo vNext.

What is inside

File	Purpose
`master_health_facilities_clean.csv`	Canonical cleaned table for broad import/testing
`master_health_facilities_clean.json`	Full JSON array for service importers/tests
`master_health_facilities_clean.jsonl`	Streaming-friendly JSONL
`tuso_facility_registry_seed.json`	Tuso facility registry seed
`ndila_facility_location_seed.json`	Ndila location seed
`ndila_health_facilities.geojson`	Ndila map layer
`facility_lookup_values.json`	Lookup values for filters/dropdowns
`facility_data_quality_report.json`	Missing codes, duplicate codes, missing/invalid coordinates
`tuso_staging_seed_postgres.sql`	Optional PostgreSQL staging seed
`CURSOR_PROMPT_facility_master_Tuso_Ndila_vNext.md`	Copy-paste-ready Cursor implementation prompt

Summary

- Records: 2023
- Open records: 1340
- Records with valid Zimbabwe coordinates: 1874
- Missing/invalid coordinates: 149
- Missing facility codes: 124
- Duplicate facility codes: 39

Recommended use

Upload the whole zip to Cursor or add the folder into the repo under something like:

```
`/docs/data/facility-master-2024-07-23/`
```

Then run the prompt in:

```
`CURSOR_PROMPT_facility_master_Tuso_Ndila_vNext.md`
```

Do not let the agent hardcode these records into frontend files. The data should be imported through Tuso/Ndila seed or staging pathways and then exposed through real APIs.
